Antisense transcript associated to tumor cells having a T(14;18)

translocation and oligodeoxynucleotides useful in the diagnosis and
translocation and tumor cells

transment of said tumor cells

Patent: US 6005095-A 20 21-DEC-1999; Capaccioli, S., Morelli, S. and Nicolin, A. Antisense transcript associated to tumor cells having a T(14;18) translocation and oligoeoxynucleotides useful in the diagnosis and treatment of said tumor cells Patent: US 6005095-A 24 21-DEC-1999; PAT 08-SEP-2000 PAT 08-8EF-2000 PAT 18-JUN-2001 ; 0 ö 0.6%; Score 28; DB 6; Length 30; 100.0%; Pred. New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding multiple drug resistance

Claim 3; Fig 6; 69pp; English.

Sassociated with development or maintenance of Chronic myelogenous lettermia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic leukemia, follicular lymphoma, B-cell acute well and procytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motifi, but may also be formed in the motifi of a hairpin, hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells alicitize inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of the ranspales for tumours. The ribozymes remove the mechanism of the ranspales for tumours. The ribozymes may also be used to study sequences given in AAQ51825-2266 represent areas of mRNAs which are genetic drift and mutations within cells. 

Sequence 37 BP; 2 A; 12 C; 12 G; 11 U; 0 other;

New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding multiple drug resistance

(RIBO-) RIBOZYME PHARM INC.

Draper KG, Thompson JD; WPI; 1993-386203/48. Claim 3; Fig 6; 69pp; English.

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous. associated with development or maintenance of chronic myelogenous. Cleukemia (CML), promyelocytic leukemia, Burkitt's lymphon, or ocute lymphocytic leukemia, follicular lymphona, B-cell acute. Iymphocytic leukemia, brast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairph, hepatitis delta virus, group intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells alicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of the ribozymes may also be used to study genetic drift and mutations within cells.

The invention relates to a composition that induces cleavage of an RNA substrate by forming a structure similar to a hammerhead ribozyme. This sequence represents a fragment of the human bcl-2 mRNA which binds the catalytic RNA AAX21302. Compositions containing catalytic RNAs can be used in pharmaceutical compositions to specifically inactivate the expression of genes in eukaryotes, prokaryotes and viruses, especially of human genes, e.g. tumour genes or viral genes or RNA molecules in a cell. They can also be used for inactivation of the expression of plant or insect genes, and used as pesticides. They can be used to identify
Compositions inducing cleavage of an RNA substrate - useful as drugs or pesticides, and for identifying the function of a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 36 BP; 10 A; 8 C; 10 G; 8 U; 0 other;

Human bcl-2 mRNA as catalytic RNA substrate.

11-MAY-1999 (first entry)

The sequences given in anylosis-zero interest areas of anthon and associated with development or maintenance of chronic myelogenous associated with development or maintenance of chronic myelogenous leakemia (CML), promyelocytic leukemia, follicular lymphoma, B-cell acute caute lymphocytic leukemia, follicular lymphoma, B-cell acute acute lymphocytic leukemia, follicular lymphoma, B-cell acute acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control sequences. These target sequences are identified by the ribozyme of the invention. The motif of a hairpin, hepatitis delta virus, group also be formed in the motif of a hairpin, hepatitis delta virus, group in intron or RNAsseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes remove the mechanism of therapies for tumours. The ribozymes may also be used to study therefore drift and mutations within cells. The sequences given in AAQ51825-2266 represent areas of mRNAs which are Claim 3; Fig 6; 69pp; English. multiple drug resistance

associated with tumours or mRNA expressed from gene encoding New enzymatic RNA molecules (ribozymes) - which cleave mRNA

This is a human bc1-2 oligonucleotide based on which an antisense oligonucleotide complementary to the translation initiation site of the human bc1-2 mRNA can be constructed. Bc1-2 antisense oligonucleotides strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of a functional bc1-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bc1-2 gene expression, especially lymphomas and some leukaemias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B cell lymphoma/leukaemia-2; bcl-2; oncogene; antisense; lymphoma; leukaemia; colon carcinoma; rectal carcinoma; pancreatic cancer; breast cancer; ovarian cancer; prostate cancer; renal cell carcinoma; hepatoma; bile duct carcinoma; choriocarcinoma; cervical cancer; testicular cancer; lung carcinoma; bladder carcinoma; melanoma; head and neck cancer; brain cancer; cytostatic; human; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The antisense oligonucleotide TI-AS (AA086643) straddles the translation-initiation site in the mRNA coding strand of the human bcl-2 gene and is complementary to this region. It reduces the expression of bcl-2 gene product thereby inducing programmed cell death of certain cancer cells. The corresp. sense bcl-1 sequence was synthesized for use as a control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotide; bcl-2 gene; lymphoma; leukaemia; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Multiple drug resistance; mdr-1; ribozyme; membrane protein; liver; resistance; chemotherapeutic agent; colchicine; doxorubicin; colon; actinomycin D; vinblastine; small intestine; kidney; adrenal gland; adenocarcinoma; bowel; transformed phenotype; promyelocytic leukemia; human; chronic myelogenous leukemia; CML; follicular lymphocytic leukemia; becell acute lymphocytic leukemia; reasst cancer; colon carcinoma; neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; hairpin; hepatitis delta virus; group I intron; RNaseP; ss.
                                                                                                                    Treating or preventing cancer, tumors and carcinomas, comprises administering B cell lymphoma/leukemia-2 antisense oligonucleotide at high doses for short period for time with one or more cancer
                                                                                                                                                                                                                                                                  The present sequence is that of a B cell lymphoma/leukaemia-2 (bcl-2) antisense oilgonucleotide. The present invention is directed to the use of bcl-2 antisense oilgomers, particularly G3139 (see ABL54148), to treat and prevent bcl-2 related disorders. Administration at high doses results in significant therapeutic responses, including low toxicity, high tolerance and prolonged survival. Administration at high doses for short periods of time (less than 14 days) also provides significant therapeutic responses in the treatment of cancer. The bcl-2 antisense oligomer may also be used to increase the sensitivity of a subject to cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      reproductive system, genitourinary system, breast, endocrine system, brain, central nervous system, peripheral nervous system, kidney, lung, respiratory system, thorax, gastrointestinal and all mentary canal, lymph nodes, pancreas, hepatobiliary system, or cancer of unknown primary site, non-Hodgkin's lymphoma, Hodgkin's lymphoma, leukaemia, colon carcinoma, rectal carcinoma, pancreatic, brain cancer, renal cell carcinoma, hepatoma, bile duct carcinoma, choricoarcinoma, ung carcinoma, hepatoma, bile duct carcinoma, choricoarcinoma, lung carcinoma, bladder carcinoma and melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               therapeutics, and in combination with hormone treatment or gene therapy. Conditions that may be treated or prevented include cancer of the haematopoietic system, skin, bone and soft tissue,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 35;

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous associated with development or maintenance of chronic myelogenous leukemia, promyelocytic leukemia, follicular lymphoma, B-cell acute cacute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of hairph, hepatitis delta virus, group intron or RNaseb-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and chear animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug frug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    resistance; chemotherapeutic agent; colchicine; doxorubicin; colon; actinomycin D; vinblastine; small intestine; kidney; adrenal gland; adenocarcinoma; bowel; transformed phenotype; promyelocytic leukemia; human; chronic myelogenous leukemia; CML; follicular lymphoma; B-cell acute lymphocytic leukemia; breast cancer; colon carcinoma;

The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, hepatitis delta virus, group intro or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and
neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; hairpin; hepatitis delta virus; group I intron; RNaseP; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CML), promyelocytic leukemia, Burkitt's lymphona, or cute lymphocytic leukemia, follicular lymphona, B-cell acute lymphocytic leukemia, follicular lymphona, B-cell acute lymphocytic leukemia, beast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a halitpin, hepatitis delta virus, group intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug frug resistance used by transformed cells and thus enhances drug theraples for tumours. The ribozymes may also be used to study
                                               Multiple drug resistance; mdr-1; ribozyme; membrane protein; liver; resistance; chemotherapeutic agent; colchicine; doxorubicin; colon; actinomycin D; vinblastine; small intestine; kidney; adrenal gland; adenocarcinoma; bowel; transformed phenotype; promyelocytic leukemia; human; chronic myelogenous leukemia; CML; follicular lymphoma: becall acute lymphocytic leukemia; brast cancer; colon carcinoma; neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; hairpin; hepatitis delta virus; group I intron; RNaseP; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding multiple drug resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 33;

The method involves selecting sequence at single genetic locus in targetted cell population that is absent from equivalent locus in non-targetted cell population, obtaining anti-sense RNA having sequence homology with the genetic locus, and permitting anti-sense RNA to hybridise with the RNA transcribed from the genetic locus to form contiguous dsRNA for activating PRR. The method is also used for treating proliferative disorders such as neoplastic slasses, psoriasis and vasculogenesis or angiogenesis. The present sequence is an antiapoptotic bcl-2-immunoglobulin heavy chain (IgH) locus fusion gene comprising chromosomal translocation t(14,18)(432;q21). The DCLL and follicular lymphoma (FT) is characterised by the chromosomal translocation of bcl-2-19H fusion gene.
                                                                                                                                                                                                                                                                                                                           genetic locus;
                                                                                                                                                                                                                                                                                                                                                  antisense; therapy; proliferative disorder; neoplastic disease; psortasis; vasculogenesis; anglogenesis; apoptosis; cytostatic; bcl-2; immunoglobulin heavy chain; IgH; fusion protein; DCLL; follicular lymphoma; FT; Chromosomal translocation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for selective killing of cells in a targetted cell population by selectively activating double stranded (ds) RNA dependent protein kinase (PRR). The method involves selecting sequence at single genetic locus in targetted cell population that is absent from equivalent locus in non-targetted cell population, obtaining anti-sense RNA having sequence homology with the genetic locus, and permitting anti-sense RNA to hybridise with the RNA transcribed from the permitting anti-sense RNA to hybridise with the RNA transcribed from the slow used for treating proliferative discorders such as neoplastic disease, psoriasis and vasculogenesis or andiogenesis. The present sequence is an anti-sense RNA targetted to antiapoptotic bloll-limmonglobulin heavy chain (IGH) locus fusion gene. The DCLL and follicular lymphoma (FT) is characterised by a t(14;18)(q32;q21) chromosomal translocation of bcl-2-IGH fusion gene.
                                                                                                                                                      Human, double stranded RNA dependent protein kinase; PKR; genetic locus; antisense; therapy; proliferative disorder; neoplastic disease; psortasis; vasculogenesis; anglogenesis; apoptoasis; cytostatic; bcl-2; immunoglobulin heavy chain; 199; fusion protein; DCLi; follicular lymphoma; FT; chromosomal translocation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          single

AAT35441-T35443 are PCR primers used to amplify the chimeric bcl-2/IgH (immunoglobulin heavy chain) gene present in the t(14; 18) chromosomally translocated non-Hodgkin's lymphoma cell line DOHH-2. The transcript produced is used for the design of antisense transcripts which can inhibit the production of bcl-2 protein in t(14; 18) translocated cells and induce cell death. The antisense transcripts can be used for the monitoring treatment of t(14; 18)-associated tumours and for translocation.
                                                  chromosome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
markers. Frimers based on these sequences can be used to detect these
repeats, especially for use in e.g paternity or maternity testing,
human genetic analysis such as linkage analysis of genetic disease,
commercial animal or plant breeding or pedigree analysis.
The repeats, when analysed, fall into 4 categories:
The repeats which are alternating tandem CA repeats with no
interruptions and without adjacent repeats of another sequence;
The repeats separated by no more than 3 consecutive non-repeat bases;
The repeats separated by no more than 3 consecutive non-repeat bases;
The repeats separated by no more than 3 consecutive non-repeat bases;
The repeats separated by no more than 3 consecutive non-repeat bases;
This no more than 3 consecutive non-repeat bases from a run of at least
The repeats which are defined as 5 or more chan consecutive on repeat bases from a run of at least
Thin interrupted dinucleotide or longer repeats of a sequence other than
The repeats which are defined as for the perfect
CG-dA)n, CG-d

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CMI), promyelocytic leukemia, Burkitt's lymphoma, or cute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs. containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, hepatitis delta virus, group in thron or RNaser-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expressed in pre-neoplastic and transformed cells and thus enhances drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of the resistance (mdr-1) mRNA specific ribozymes enhances drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-Hodgkin's lymphoma; cell line DOHH2; DHL-4; leukaemia; chromosome; t14; t18; q32; q21; N region; antisense; expression; inhibitor; bcl-2; IgH; immunoglobulin heavy chain; hybrid; cell death; tumour; cancer; neoplasia; diagnosis; translocation; chimera; PCR; polymerase chain reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Non-Hodgkin's B cell line bel-2/19H chimeric gene PCR primer.
                                                                                                                                                                           New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.6%; Score 28; DB 14; Length 28

The chromosomal tocalisation was assigned to the Angelman Syndrome/Prader-Willi Syndrome region at 15q11-13. The dinuclectide repeat was confirmed to be on chromosome 15 by PCR of somatic cell hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; halrpin; hepatitis delta virus; group I intron; RNaseP; ss.

New chimeric bcl-2/IgH antisense transcript of t(14; 18) translocated cells - used to develop oligodeoxynucleotides for the diagnosis and treatment of tumours associated with the translocation.

Example 1; Page 12; 32pp; English

AAT3541-T35443 are PCR primers used to amplify the chimeric bcl-2/IgH (immunoglobulin heavy chain) gene present in the t(14: 18) chromosomally translocated non-Hodgkin's lymphoma cell line DOHH-2. The transcript produced is used for the design of antisense transcripts which can inhibit the production of bcl-2 protein in t(14: 18) translocated cells and induce cell death. The antisense transcripts can be used for the diagnosis and treatment of t(14: 18) -associated tumours and for monitoring treatment of a pathology associated with a t(14: 18) translocation

for the New chimeric bcl-2/IgH antisense transcript of t(14; 18) translocated cells - used to develop oligodeoxynucleotides diagnosis and treatment of tumours associated with the translocation.

Example 1; Page 12; 32pp; English. 

AAT35446 and AAT35447 are PCR primers used to amplify the chimeric

bcl-2/IgH (immunoglobulin heavy chain) gene present in the t(14; 18) chromosomally translocated non-Hodgkin's lymphoma cell line DOHH-2. The primers correspond to the 3' untranslated region of the bcl-2 gene. The transcript produced is used for the design of antisense transcripts which can inhibit the production of bcl-2 protein in t(14; 18) translocated cells and induce cell death. The antisense transcripts can be used for the diagnosis and treatment of t(14; 18)-associated tumours and for monitoring treatment of a pathology associated with a t(14; 18) translocation.

The protein has increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence was used to amplify DNA encoding the human Bc1-2 protein.

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AR298483-514 represent sequences from Hallotis discus, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-dA)n.(dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis.

The repeats, when analysed, fall into 4 categories:

1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence.

2) imperfect repeats which are defined as 2 or more runs of uninterrupted CA repeats spearated by no more than 3 consecutive non-repeat bases;
                                                                                       containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf42 which contains the repeat
having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22222222222228
                                                                                                     The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonoucleotide probe.
Cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ac. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primmers for in vitro amplification of the corresp. microsatellite (using the program of the microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait closi, or genes involved the determinism of economically important set is also AAQ33501-34437.

3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinuclectide or longer repeats of a sequence other than (dC-dA)n. (dG-dT)n, or from at least 10 uninterrupted mononuclectides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted. The sequence presented here is an example of a perfect repeat sequence of structure: (CA)20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer additton (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X sociated with a neurodegenerative disease including fragile X pracrome, Huntington's disease, or muscular dystrophy. Furthermore, the method may be used for identifying and/or typing microorganisms including yeasts and lower uni- and multi-callular organisms, as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method is also useful for detecting certain cancers and other malkers for use in identification of human and non-human individuals, plants and
                                                                                                                                                                                                                                           ö
assessing variation between SSR varieties and testing the purity of great or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR.
                                                                                                                                                                                                                                           Gaps

microorganisms, to ascertain parentage of human or non-human individual, and to monitor responses to therapies including the possibility of uncleic acid damage. The nucleotide polymorphisms may be used in forensic science to identify a particular victim or an alleged perpetrator of a crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide repeat regions such as a nucleotide length polymorphism in a eukaryotic genome. The LASA method avoids the time and cost required by prior art methods using gel electrophoresis and Southern transfer analysis.

The particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total confidence of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                       ö

```

This reporter is used to determine which breakpoint is present in the MBR and mcr amplified sequences detected using AAQ30096-101.

```
The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic leukemia, follicular lymphoma, B-cell acute
The terminal amino gps. are used to conjugate the reporter to alkaline phosphatase, making them "signal generating" probes. They are used in a method for the detection of chromosomal abnormalities eg. translocations correlated to a neoplastic state such as those related to T and B lymphocytes eg. follicular lymphoma. The method provides a quantitative measurement and provides a veryhigh degree of specificity minimising the risk of false positives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; hairpin; hepatitis delta virus; group I intron; RNaseP; ss.

lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motiff, but may also be formed in the motif of a hairpin, hepatitis dolta virus, group intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug cells elicits inhibition of the transformed state. Multiple drug drug resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the resistance used by transformed cells and thus enhances drug the modulation of the ribozymes remove the mechanism of the removed the recent of the removed the mechanism of the removed removed removed the removed rem

Clinically validating target from disseminated cancer cells by determining whether status of target determined in cancer cells of individuals correlates with cancer-related information about clinical status of individuals -

Example 3; Page 55; 57pp; English.

a target from disseminated cancer cells, characterised in that for a population of individuals it is determined whether a status of the target determined in disseminated cancer cells of the individuals correlates with at least one cancer-related information about the clinical status of the individuals. The method is useful for clinically validating target from disseminated cancer cells. The present sequence is a probe used to demonstrate the method of the invention. The present invention relates to a method for the clinical validation of

One out of 50 chones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (FG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite sequence (Using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mooi DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
251 one out of 50 clones cross-hybridised. Assuming independent of distribution of microsatellites and Mbol sites, the frequency of (TC) >9 microsatellites and Mbol sites, the frequency of (TC) >9 microsatellites in the bovine genome is estimated at >100, construction of the specification and indexed herein (see below).
252 The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primmers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, corresp. in cattle, the determinism of economic trait clori, or genes involved the determinism of economically important craits esp. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements core included are a nucleic acid primer prince and primers of ryegrass or fescue genomic DRA enriched for SRRs and included are a nucleic acid primer of ryegrass or fescue genomic DRA enriched for SRRs and included in the library containing SSRs, a library of ryegrass or fescue genomic DRA enriched for SRRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely cassociated with the gene such that the SSR in the selecting for the SSR in the second backed for DNA profiling grass or cereal species varieties by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal core breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to cetablish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species varieties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mool DNA fragments of between 250 and 500 bp with an (AC)15 and a (FC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (FG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites in the specification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.
                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (ACJ15 and a (TC)15 oligonoucleotide probe.

Cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TC)n >9 microsatellites in the bovine genome is estimated at >100, co. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primars for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, correspecting, and in the genetic mapping of economic trait closi, or genes invalved the determinism of economic trait traits esp in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                Polymorphic bovine DNA markers – used in genetic identification, gene mapping, and selective breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC one out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 200 000. The sequence information for a. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

CT we sequence upstream and downstream of the microsatellite sequence used to generate the required PCR primmers for in vitro amplification of the corresp. microsatellite (using the program optimization). The microsatellites may be used to identify individuals, and in the genetic mapping of economic trait clori, or genes involved the determinism of economically important traits sep. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 330 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

screening a library of bovine MDOI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MDOI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important
amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones chromosome-specific phage untrained by hybridisation of chromosome-specific phage ilbraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated by hybridisation of clones were amplified by primers Arafo799 # T6047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf79 which contains the repeat sequence having the formula: (AC)15.5.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primars based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAR5798-766047. Those clones where the repeat sequence has been determined are shown in AAR55704-797. This sequence having the formula: (CA)15.5.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 algonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >10, co. 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCN primers for in vitro amplification of the corresp. microsatellite (using the program OPTIREM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait coi, or genes involved the determinism of economically important criaits esp. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dh)n.(dg-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of probe. Over 100 repeat blocks were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dh).(dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAr65798 r66047. Those clones where the repeat sequence has been determined are shown in AAr65704-797. This repeat sequence is from the marker clone Mdf64 which contains the repeat sequence having the formula: (AC)15.5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAPG5798-T66047. Those clones where the repeat sequence has been determined are shown in AAPG5704-797. This repeat sequence is from the marker clone Mdfill9 which contains the repeat sequence having the formula: (AC)16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Also described are: (1) a peptide encoded by (1); (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polynucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a portion of (I); (5) a method for detection of a polynucleotide encoding alpha 7-hnAchR in a biological sample; and (6) a method for amplification of nucleic acid from a sample suspected of containing nucleic acid encoding alpha 7-hnAchR. The primers and probes from the present invention can be used on brain tissue and blood samples of humans suspected of suffering from schizophrenia, small cell lung carciloma, breast cancer and nicotine-dependent illness. This is particularly useful for diagnosis of schizophrenia. Other illnesses that can be studied/diagnosed are epilepsy (e.g. juvenile myoclonic
containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT05798-766047. Those clones where the repeat sequence has been determined are shown in AA065704-797. This repeat sequence is from the marker clone Mdf55 which contains the repeat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA298483-514 represent sequences from Haliotis discus, used in the method of the invention.

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X associated with a neurodegenerative disease including fragile X expurome, Huntington's disease, or muscular dystrophy. Furthermore, the method is also used for identifying and/or typing microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method is also useful for detecting certain cancers and other malignancies. Moreover, the method can be used to provide markers for use in identification of human and non-human individuals, plants and confurnant or monitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of a crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime if he LASA method avoids the time and cost required by prior art methods using mel alength polymorphism in a eukaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              art methods using generation of the process and Southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the invention.
                                                                                                                                                                         Microsatellite; ligase-assisted spacer addition assay; LASA; cancer; nuclectide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-assisted spacer addition assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Giffard PM;
                                                                                       Human microsatellite D1S191 detection PCR primer #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Brockhurst V, Timms P, Wolter L, Barnard R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 32 BP; 16 A; 16 C; 0 G; 0 U; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe.

250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe.

260 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TF)n >9 microsatellites in the bovine genome is estimated at >100, COO. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program of PTPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The sequence is that of a bovine microsatellite sequence obtd.

by screening a library of bovine MboI DNA fragments of between
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
250 one out of 50 clones cross-hybridised. Assuming independent
251 distribution of microsatellites and MboI sites, the frequency of
252 (T6) >9 microsatellites in the bovine genome is estimated at >100,
253 ono. The sequence information for ca. 230 such bovine microsatellites
253 summarised in the specification and indexed herein (see below).
254 The sequences upstream and downstream of the microsatellite sequence
255 omericallites may be used to identify individuals,
256 for parentage testing, and in the genetic mapping of economic trait
257 clori, or genes involved the determinism of economically important
258 close, in cattle, to allow selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity teating, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of probe. Over 100 repeat blocks were isolated by hybridisation of probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf3 which contains the repeat sequence having the formula: (CA)16C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of probe. Over 100 repeat blocks were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT67798-Y66047. Those clones where the repeat sequence has been determined are shown in AAT65704-7797. This repeat sequence is from the marker clone Mdf58 which contains the repeat sequence having the formula: (CA)16.5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequence 22, Application US/09735363A

Patent No. US20010041681A1

Patent No. US20010041681A1

GENERAL INFORMATION

APPLICANT: Fillin, Mario

APPLICANT: Fillin, Migel

APPLICANT: Fillin, Migel

APPLICANT: Phillip, Nigel

APPLICANT: Phillip, Nigel

TITLE OF INVENTION: Therapeutically Useful Synthetic Oligonucleotides

TITLE OF INVENTION: Therapeutically Useful Synthetic Oligonucleotides

CURRENT APPLICATION NUMBER: US/09/735,363A

CURRENT FILING DATE: 1099-12-13

PRIOR FILING DATE: 1999-12-13

PRIOR APPLICATION NUMBER: 60/728,925

PRIOR PELICATION NUMBER: 60/228,925

PRIOR FILING DATE: 2000-08-29
